

Ex-no: 4	AWK SCRIPTING
05/02/2026	

Aim

To study and use **AWK scripting** for pattern scanning and text processing in Linux.

Algorithm

1. Open the Linux terminal.
2. Create a sample text file using any editor (`vi` or `nano`).
3. Use AWK commands to read and process the file.
4. Apply pattern matching and field-based operations.
5. Execute different AWK commands for printing, filtering, and calculations.
6. Verify the output produced.

Basic Commands

1. Basic Syntax

- `awk '{print}' file.txt` → Prints entire file
- `awk '{print $1}' file.txt` → Prints first column
- `awk '{print $1, $2}' file.txt` → Prints first and second columns

2. Pattern Matching

- `awk '/pattern/ {print}' file.txt` → Prints lines matching pattern
- `awk '$1=="value" {print}' file.txt` → Matches specific field value

3. Built-in Variables

- `awk '{print NR, $0}' file.txt` → Prints line number with content
- `awk '{print NF}' file.txt` → Prints number of fields in each line

4. Arithmetic Operations

- `awk '{sum += $1} END {print sum}' file.txt` → Calculates sum
- `awk '{print $1 * $2}' file.txt` → Multiplies columns

5. Field Separator

- `awk -F "," '{print $1}' file.csv` → Uses comma as delimiter

OUTPUT:

The screenshot shows a terminal window titled "maheendran.s@localhost:~/Myproject" with a search icon, a menu icon, and a close button. The terminal displays the following commands and output:

```
[maheendran.s@localhost Myproject]$ vi file.txt
[maheendran.s@localhost Myproject]$ awk '{print}' file.txt
Welcome World
Good and Warm Welcome to Linux
[maheendran.s@localhost Myproject]$ awk '{print $1}' file.txt
Welcome
Good
[maheendran.s@localhost Myproject]$
```

Result

The AWK scripting commands were executed successfully for pattern scanning and text processing. The experiment demonstrated how AWK can be used to extract, filter, and manipulate data efficiently.
